

General EDA

1. Load libraries “dplyr” “ggplot2” and “tidyverse”
2. Read in my cleaned main dataset
3. Graph 1: Line graph of Unemployment Rate Over Time
 - a. Downwards trend until 2018
 - i. Great Recession recovery period
 - b. 2018-2020 plateau
 - i. “Full employment” period, as many jobs filled as possible
 - c. 2020-2023 aggressive spike and drop
 - i. COVID-19 pandemic
 - d. 2023, slow trend upwards exponentially increasing
 - i. Pandemic recovery period
 - ii. Shifting political climate
4. Graph 2: Diverging graph of Unemployment Month-to-Month Net Change
 - a. Generally stable, mostly negative
 - b. COVID-19 spike
 - i. Over 50% change
 - c. Post COVID recovery
 - i. -10% change consistently over a year
5. Graph 3: Seasonal Patterns in Unemployment Across Years
 - a. Higher changes around spring/summer months
 - b. Slight increase around November-January
6. Graph 4: Density graph of Unemployment Percentages
 - a. Majority resides around 4% unemployment
 - b. Slight trail around ~15% unemployment
 - i. World event spikes
 - c. Slight other bump around 7% unemployment
7. Graph 5: Line graph of Unemployment Rate Over Time by State
 - a. Maine and New Jersey experience sharper peaks around COVID/COVID recovery periods
 - i. East coast states
 - b. Arizona and Tennessee have the most consistent lines
 - i. Southern states
